

Report

First of all, I know that I am not pretty good in documenting so if there is anything that is not clear please let me know.

Secondly, if there is any any step that takes many procedures and there is already a shortcut way to get the same result, please let me know it to improve my skills and not taking the long path again.

Finally, I would like to ask few questions in order to improve myself:

1. How can I know which statistics can I pop them up to the user ? Is it something I will gain by experience or is there a criteria that every data scientist following?

2. As by your sense of experience, which is better or good looking while developing data science stuff writing scripts or jupyter notebook ?

I hope I couldn't rely too much on you and I am so glad that I could take this opportunity.

Thank you:)
David
